

Biomass Fly Ash in Concrete II

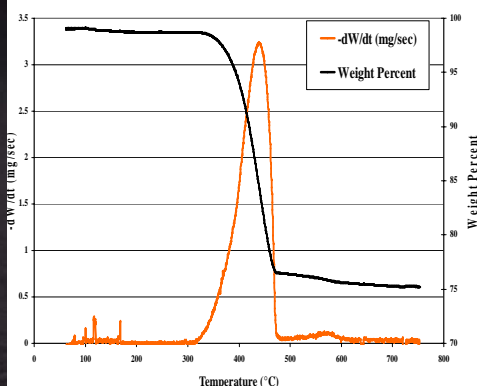

Shuangzhen Wang, Sharon Bragonje, Justin Tullis and Larry Baxter

Objective:

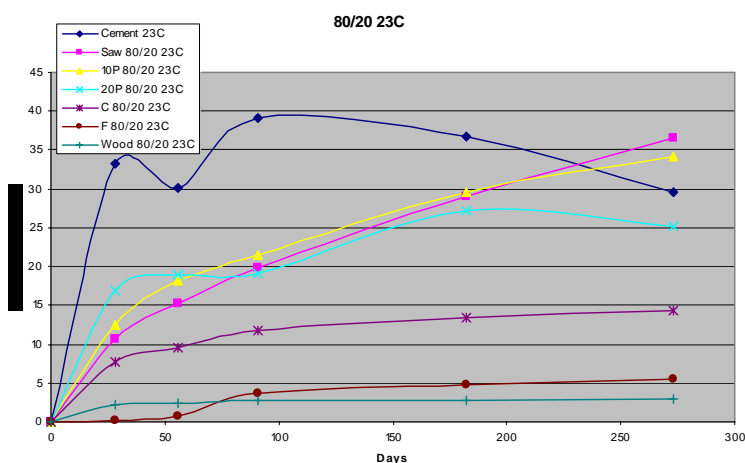

This poster determines the strength build-up and quantitative kinetics of pozzolanic reaction between biomass /coal ash with $\text{Ca}(\text{OH})_2$. The strength of biomass ash samples is **2-3 times** stronger than coal ash ones and even comparable to those of pure cement ones (2-in cube); The $\text{Ca}(\text{OH})_2$ consumption rate was determined by TGA and the data imply a diffusion controlled mechanism.

Vacuum sealed in Mason Jar TGA Analysis of $\text{Ca}(\text{OH})_2$

Keep samples from CO_2 attack.

Strength Build-up

Statistical Analysis of Strength Build up by Fly Ash

(means are indicated by solid circles)

Bottoms and tops of boxes represent the 95% confident intervals

Reaction Mechanisms

Cement Hydration

Pozzolanic Reaction (fly ash with $\text{Ca}(\text{OH})_2$)

Experimental Setup

Item	Description
Fly ash (6)	C, F, Wood, SAW, 10P and 20P
Water / (fly ash + $\text{Ca}(\text{OH})_2$) (mass)	0.5
Sand / (fly ash + $\text{Ca}(\text{OH})_2$) (mass)	2
Fly ash / $\text{Ca}(\text{OH})_2$ (mass)	80 / 20, 70 / 30, 60 / 40
Temperatures (3)	23°C, 43°C, 63°C
Testing Dates (6)	1, 2, 3, 6, 9 and 12 months after mixing
Replicates	2

Quantitative Kinetics

(first order to fly ash and $\text{Ca}(\text{OH})_2$, respectively)

$$\frac{d\alpha_{\text{Ca}(\text{OH})_2}}{dt} = k(1 - \alpha_{\text{Ca}(\text{OH})_2})(1 - \alpha_{\text{ash}})$$

	K^0 (month ⁻¹)	Ea/R (K)	b	R ²
Class F	199453	3639	1.857	0.95
Class C	38.71	986.2	2.28	0.94
Wood	5.05	191.1	2.99	0.93
10P	2408	2316	1.74	0.94
20P	2535	2391	1.86	0.93
SAW	245700	3688	1.71	0.96

b is the stoichiometric parameter, one gram of fly ash combines with b grams of $\text{Ca}(\text{OH})_2$
